INDEPENDENT EQUITY RESEARCH

bioMérieux

Company Overview

Company: bioMérieux SA
Ticker: BIM (Euronext Paris)
ISIN: FR0013280286
Sector: Healthcare - In Vitro Diagnostics
Headquarters: Marcy-l'Étoile, France [1]
Prepared by: Erica Zheng
Information current as of 23 July 2026

Research focus

Can growth in molecular diagnostics, microbiology and recurring reagent sales support sustainable revenue growth, margin expansion and long-term shareholder value?

Executive summary

bioMérieux is a French in vitro diagnostics company serving clinical laboratories, hospitals and industrial customers. Its business model combines instrument placements with recurring sales of proprietary reagents, test panels and consumables. The company holds established positions in clinical microbiology and syndromic molecular diagnostics, while its principal growth opportunities include point-of-care testing, non-respiratory molecular panels, antimicrobial resistance and industrial quality control. Key risks include foreign-exchange exposure and respiratory-season variability. Additional risks include regulatory delays, China weakness and execution on acquired technologies. [1, pp. 14-15 and 25-27][2, pp. 5, 12 and 20]

Portfolio stage: company research and business-model analysis. Valuation and investment recommendation will be developed separately.

Citations [1]-[3] refer to the source list in Section 7.

1. Company profile and market position

bioMérieux is a French in vitro diagnostics company that develops, manufactures and markets systems used to test biological samples outside the human body. Its products help hospitals, clinical laboratories and industrial customers detect infectious diseases, identify microorganisms and monitor the safety and quality of food, pharmaceutical and cosmetic products. [1, pp. 22-26]

The company has operated for more than 60 years, maintains a direct presence in 46 countries and serves more than 160 countries through subsidiaries and distributors. More than 94% of revenue is generated outside France. According to company estimates, bioMérieux holds approximately 40% of the global clinical microbiology market and around 70% of the syndromic multiplex molecular diagnostics segment through its BIOFIRE platform. [1, pp. 2-3 and 25-27]

FY2025 financial snapshot

Revenue	**€4,070m**	**Clinical applications**	**84% of revenue**
Industrial applications	**16% of revenue**	**Reagents and consumables**	**83% of revenue**
Gross margin	**56.7%**	**CEBIT margin**	**17.9%**
R&D expenditure	**€507m**	**Free cash flow**	**€462m**
Adjusted diluted EPS	**€4.64**	**Proposed dividend**	**€0.98/share (+9%)**

Sources: application and revenue mix: [1, pp. 2-3 and 25-26]; revenue, margins and R&D: [2, pp. 4 and 13]; free cash flow: [2, p. 15]; adjusted EPS and proposed dividend: [2, p. 14]. Figures are presented in euros unless stated otherwise.

2. Products and technologies

bioMérieux's portfolio is organised around molecular diagnostics, microbiology, immunoassays and industrial applications. [1, pp. 25-26]

Molecular diagnostics

BIOFIRE FILMARRAY TORCH runs multiplex PCR panels that can detect numerous pathogens from a single patient sample in roughly one hour, covering respiratory infections, gastrointestinal illnesses, blood-culture identification and meningitis. The newer BIOFIRE SPOTFIRE system brings syndromic testing closer to the patient, with results in approximately 15 minutes. [1, pp. 28-44]

Microbiology

The company provides an integrated microbiology workflow, including BACT/ALERT for blood-culture detection, VITEK systems for bacterial identification and antimicrobial susceptibility testing, VITEK MS PRIME for mass-spectrometry identification, and culture-media and susceptibility-testing products such as CHROMID and ETEST. [1, pp. 28-44]

Immunoassays and industrial applications

The VIDAS platform performs automated immunoassays for sepsis markers, cardiac emergencies and infectious diseases. The acquired SpinChip platform is intended to extend point-of-care immunoassay capability. For industrial applications, bioMérieux supplies microbiological quality-control systems to food, pharmaceutical and cosmetic manufacturers, including GENE-UP for pathogen detection and Accellix for cell- and gene-therapy quality control. [1, pp. 16-17 and 28-44]

3. Customers and geographic exposure

Clinical customers include hospital and commercial laboratories, blood banks, emergency departments and physician offices. Industrial customers include pharmaceutical manufacturers, food producers, cosmetic companies, contract testing laboratories and veterinary laboratories. [1, pp. 14-15 and 27]

North America	EMEA	Asia Pacific	Latin America
45%	**32%**	**16%**	**7%**

4. Business model and recurring revenue

bioMérieux uses an instrument-and-consumables model. Instruments may be sold directly or placed at customer sites under contracts that require minimum reagent purchases over several years. Direct instrument sales contributed approximately €282 million in 2025, or about 7% of group revenue. [1, pp. 25-26]

The larger revenue contribution comes from reagents, test panels and consumables. bioMérieux's systems are predominantly closed, meaning only proprietary reagents and consumables can be used on them. Each test performed on an installed instrument can therefore generate a recurring sale. Reagents and consumables represented approximately 83% of 2025 revenue. At year-end, the installed base included approximately 28,500 BIOFIRE instruments and 6,400 SPOTFIRE instruments, providing a sizeable platform for repeat panel sales. [1, pp. 25-26][2, p. 5]

Services and software include instrument installation, maintenance, user training and data-management tools. Industrial testing products provide a separate revenue stream from quality-control testing in food, pharmaceutical and cosmetic production. [1, pp. 14-15 and 25-26]

1 **Instrument sale or placement**	2 **Customer adoption and workflow integration**	3 **Recurring reagent and test-panel purchases**	4 **Service, software and replacement-cycle revenue**
Instrument sold or placed at the customer site.	Staff trained; workflow validated and integrated.	Each test uses proprietary panels and consumables.	Maintenance, software, new assays and replacement.

Source: author's analysis based on [1, pp. 14-15 and 25-26].

Why customers make recurring purchases

- Proprietary consumables: installed instruments generally require compatible bioMérieux reagents and test panels. [1, pp. 14-15 and 25-26]
- Operational switching costs: changing platforms can require new equipment, staff retraining, workflow revalidation and laboratory-system integration. [1, pp. 14-15 and 25-26]
- Essential testing demand: many infectious-disease, blood-culture and pharmaceutical quality-control tests remain clinically or regulatorily necessary. [1, pp. 14-15 and 25-26]
- Broad menu: revenue is diversified across a large number of tests and consumables rather than a small number of individual products. [1, pp. 14-15 and 25-26]

Resulting financial characteristics

The recurring model supported a 56.7% gross margin, a 17.9% CEBIT margin and €462 million of free cash flow in 2025. The company also reinvested €507 million, equivalent to 12.5% of revenue, in research and development. [2, pp. 13 and 15]

5. Main growth opportunities

bioMérieux's GO·28 plan targets 7% organic sales CAGR through 2028 and at least 10% annual CEBIT growth. For 2026, management guides to organic sales growth of 5%-7% and organic CEBIT growth of at least 10%. These are management objectives rather than guaranteed outcomes. [2, pp. 20 and 24][3]

BIOFIRE non-respiratory panels: Sales reached €598 million in 2025 and grew 10% organically. The broader BIOFIRE installed base reached 28,500 instruments at year-end, up 7%, after 1,800 net additions. In the author's view, further growth could come from cross-selling additional panels and expanding adoption outside North America. [2, p. 5]

SPOTFIRE adoption: SPOTFIRE grew 84% organically to €168 million in 2025. The medium-term opportunity depends on continued instrument placements, test utilisation and timely regulatory approvals for additional panels. [2, p. 5]

Antimicrobial resistance: Demand for faster pathogen identification and susceptibility testing may support microbiology growth, although the VITEK REVEAL impairment demonstrates the importance of commercial execution. [1, pp. 22-24 and 28-44][2, p. 14]

Industrial applications: Pharmaceutical quality control, food safety and the emergence of cell- and gene-therapy manufacturing may increase demand for specialised microbiological and molecular testing. [1, pp. 16-17 and 28-44][2, p. 5]

Capital deployment: 2025 acquisition cash outflows included approximately €112 million for SpinChip, €8 million for Neoprospecta and €19 million for Day Zero Diagnostics assets. Accellix was acquired in January 2026 at an enterprise value of approximately €45 million. These transactions broaden the product pipeline but increase integration and execution risk. [1, pp. 16-17][2, p. 17]

Geographic expansion and efficiency: Latin America grew strongly in 2025, while a stabilisation in China would improve the regional mix. The GO.Simple programme is intended to support operational efficiency and margin development. [2, pp. 7 and 12]

6. Principal business risks

Risk	Potential effect
Competition and technological change	Large diagnostics groups and specialist competitors are investing in molecular, point-of-care and rapid susceptibility-testing platforms. [1, pp. 22-27]
Regulatory and product-approval timing	Delays under the EU IVDR framework or US FDA processes could defer product launches and anticipated revenue. [1]
Research and development execution	The €141 million VITEK REVEAL impairment in 2025 illustrates that acquired and internally developed technologies may commercialise more slowly than expected. [2, p. 14]
China and market-specific weakness	China sales declined 14% in 2025 amid procurement pressure, local competition and a weaker operating environment. [2, p. 12]
Foreign exchange	Approximately 75% of revenue is denominated in non-euro currencies. Currency movements reduced 2025 sales by €151 million and CEBIT by about €33 million. [2, p. 21][3, pp. 2 and 4]
Respiratory-season variability	BIOFIRE respiratory-panel demand depends partly on the severity and timing of flu and respiratory-virus seasons, creating volatility between quarters and years. [2, pp. 6 and 20]
Healthcare spending and pricing	Hospital budgets, reimbursement changes and laboratory consolidation could delay instrument purchases or increase pricing pressure. [1]

7. Sources and methodology

This overview is based solely on publicly available company information. Company market-share estimates, management targets and forward-looking statements are identified as such. Page-level citations and extracted data are maintained in the accompanying source log.

Methodology notes

- Currency: euro unless otherwise stated.
- Financial year: year ended 31 December 2025.
- Organic growth, CEBIT and other alternative performance measures follow the company’s definitions.
- Market-share figures are company estimates and have not yet been independently verified in this introductory stage.
- Forward-looking statements and guidance are stated as of 23 July 2026 and should be updated when new results are published.
- This document describes the business only; it does not contain a completed valuation or investment recommendation.
